

# PHYSICS COLLOQUIUM: From Materials to Cosmology: Studying the Early Universe Under the Microscope

Nicola Spaldin

Materials  
ETH Zürich

## About The Speaker:

Nicola Spaldin is the Professor of Materials Theory at ETH Zurich. She developed the class of materials known as multiferroics, combining simultaneous ferromagnetism and ferroelectricity, for which she received the 2017 L'Oréal-UNESCO for Women in Science award. She is a passionate science educator, coordinator of her department's curriculum development program "The Materials Scientist 2030, Who is She?", and holder of the ETH Golden Owl Award for excellence in teaching. When not trying to make a room-temperature superconductor, she can be found playing her clarinet, skiing, or climbing in the Alps.

## Abstract:

Uncovering the behavior of the early universe just after the Big Bang is an intriguing fundamental activity that is extraordinarily difficult because of insurmountable issues associated with replaying the Big Bang in the laboratory. One route to the answer -- which lies at the intersection between cosmology and materials science -- is to use laboratory materials to test the laws proposed for the formation of defects such as cosmic strings in the early universe. Here I will show that a popular multiferroic material, hexagonal yttrium manganite -- with its coexisting magnetic, ferroelectric and structural phase transitions -- generates the crystallographic equivalent of cosmic strings. I will describe how straightforward solution of the Schroedinger equation for yttrium manganite allows the important features of its behavior to be identified and quantified, and present experimental results of what seem to be the first unambiguous demonstration of the expected cosmological scaling laws in a real material. I will end with a plea for help with imaging the multiferroic "cosmic strings", and show some recent data suggesting that things might be less unambiguous than they seem.
